

Chapter 186

Using the Deliver Page

Once you've finished grading your project, you need to either render it, or output it to tape to deliver it to your client. This is where the Quick Export window and Deliver page comes in.

This chapter describes how to use Quick Export, how to use the overall interface of the Deliver page, and provides some general information about how effects are output from DaVinci Resolve in different situations.

The Render Queue	4031
Drag to Reorder Jobs in the Render Queue	4032

Using Quick Export

Not every situation requires a complicated delivery setup. When you just need to quickly export a project, and the full power of the Deliver page is unneeded, you can choose File > Quick Export to use one of a variety of export presets to export your program from any page of DaVinci Resolve. You can even use Quick Export to export and upload your program to one of the supported video sharing services, including YouTube, Vimeo, and Frame.io. You can also add your own presets to the Quick Export window.

To use Quick Export:

- 1 (Optional) In the Cut, Edit, Fusion, or Color page, set In and Out points in the Timeline to choose a range of the current program to export. If no timeline In or Out points have been set, the entire timeline will be exported.
- 2 Choose File > Quick Export.
- 3 Select a preset to use from the top row of icons in the Quick Export dialog, and click Export.
- 4 Choose a directory location and enter a file name using the export dialog, then click Save. A progress bar dialog appears to let you know how long the export will take.

The Quick Export Dialog showing a custom preset.

To Create a New Custom Preset and Add it to Quick Export:

- 1 On the Deliver page, select Custom Export from the Render Settings, and adjust the Video, Audio, and File settings for your new preset. Only Single Clip settings can be made Custom Presets, not Individual Clips.
- 2 In the Render Settings 3-dot option Menu, select Save as New Preset.
- 3 Type in a name for your new Preset, and choose a preset icon to represent it.
- 4 Check the Add to quick export box.
- 5 Click Save.

Your preset and icon will now be added to the Quick Export dialog across all pages of DaVinci Resolve, and also be added to the Render Settings in the Deliver page.

The List View icon (circled) in the Quick Export dialog

To View the Quick Export Options in List View:

- 1 Open the Quick Export Dialog.
- 2 Click on the List View icon in the Render Settings.

Assign Icons to User Presets

When you create a new Custom Preset in the Deliver page, in addition to entering a name, you can now choose an icon from the list to represent it in the Render Settings and Quick Export dialog.

Creating a new Custom Preset in the Deliver page

The Deliver Page

The Deliver page is divided into five areas of functionality, each of which lets you set up a different part of a render or output to tape.

Deliver page

The Interface Toolbar

At the very top of the Deliver page is a toolbar with buttons that let you show and hide different parts of the user interface. These buttons are as follows, from left to right:

The Interface toolbar

	Delivery full/half height button: Lets you set the Render Settings panel to take up the full height of your display, if you need more area for browsing the various render settings, at the expense of a narrower Timeline.
	Render Settings: This panel lists all of the render settings that are available for configuring rendering jobs in DaVinci Resolve. By default, you're presented with a short list, but more options are available by clicking "Advanced Settings."
	Tape: Puts the Deliver page into Tape Output mode.
	Clips: Hides or shows the Thumbnail timeline above the Deliver page timeline

	Render Queue: A list of all jobs that you've set up to render in the current project. Previously rendered jobs remain in the queue, for your reference or for you to reuse to re-render those jobs, unless you manually delete them from the queue.
	Render Queue full/half height button: Lets you set the Render Queue to take up the full height of your display, if you need more area for listing render jobs at the expense of a narrower Timeline.

The Render Settings

The Render Settings contains the customizable settings that determine how media is rendered out of DaVinci Resolve. If you're using the Tape option, these settings are disabled.

The Render Settings are divided into four general sections:

Render Presets: At the very top, a scrollable row of icons lets you choose one of a series of presets to quickly set up the type of render you want. The Custom option exposes all render settings so you can set up a render manually.

Render Location: A Browse button opens a dialog that lets you choose a volume and directory to render to.

Render: Two options let you either render the entire selected area of the Timeline as a single clip suitable for reviewing or mastering, or as a series of individual clips more suited to round-trip workflows. The option you choose here changes which render settings are available below.

Video, Audio, and File Render Settings Panels: All other render settings are divided among three panels. Checkboxes at the top of the Video and Audio panels let you selectively disable video export (if you want to export the audio only) or disable audio export (if you want to export video only).

For more information on all of these settings, see *Chapter 187, "Rendering Media."*

Render Settings

Rendering Files vs. Outputting to Tape

Because the Deliver page does double duty, you control whether you're rendering files or outputting to tape using the Tape button in the Interface toolbar. Doing so replaces the controls in the Viewer with tape controls.

Render or Edit to Tape modes

The Deliver Page Timeline

You'll use the Timeline in the Deliver page to define the range of clips you want to render or output to tape, and to choose which versions for each clip you want to output. The Deliver page Timeline consists of a Thumbnail timeline at top (that can be shown or hidden via the Clips button) that makes it easy to select individual clips or ranges of clips that you need to render, and a more ordinary timeline below that you can use to set In and Out points for rendering arbitrary regions of your program. A Timeline toolbar lets you choose the render range of the Timeline, and has controls for customizing the look of the Timeline, and for zooming in and out.

The Deliver page's Timeline and Thumbnail timeline

TIP: Press Shift-Z to fit the entire program into the available width of the Timeline.

Filtering the Thumbnail Timeline

The Deliver page Thumbnail timeline also has the Timeline Filter dropdown, available to the right of the Clips button in the Interface toolbar.

The Deliver page's Thumbnail timeline matches the Color page

Using this dropdown to filter the contents of the Timeline lets you restrict the range of media you want to output in different ways. For example, if you've already rendered a timeline, but you've since made some changes, you can use one of the "Modified Clips" options to display only the clips that have changed within a particular timeframe. Another commonly used option is to choose "Unrendered Clips" to isolate all clips that have not yet been rendered in workflows where you're only rendering a part of the Timeline at a time.

When you filter the Thumbnail timeline, you can only set up jobs to render in Individual Clips mode. You can tell if Thumbnail filtering is enabled by an orange underline under the Clips button in the UI toolbar.

An orange line under the Clips button shows that filtering is enabled

The Viewer

When rendering file-based media, the Viewer shows you exactly how the media being output will look using the current settings, and the transport controls move the playhead throughout the current Timeline. Audio playback can be turned on or off by clicking on the speaker icon, or adjust the level by right-clicking on the speaker icon and dragging the slider.

Deliver page Viewer

When outputting to tape, the Viewer shows you the tape output so you can set up insert or assembly edit points, and the transport controls move the tape in the deck if device control is enabled. You can also put the Viewer into Cinema Viewer mode by choosing **Workspace > Viewer Mode > Cinema Viewer (P)**, so that it fills the entire screen. This command toggles Cinema Viewer mode on and off.

Disabling Viewer Updates While Rendering

An Updates During Renders submenu in the Render page Viewer option menu lets you choose to disable, minimize, or enable Viewer updates while a program is being rendered. Disabled or minimized Viewer updates will speed rendering, especially on slower workstations.

The Render Queue

The Render Queue is a list of all the jobs you’ve queued up for delivery. Each job can have an individualized range of clips and render settings, which you can use to render multiple sections or clips of a timeline, the same timeline output to multiple formats, or multiple timelines.

The Render Queue also has the option to show either just the jobs within the current project, or jobs queued up and saved within all projects in the currently open SQL network project library (for the current user) or local project library (at the currently selected disk location). This can be exceptionally useful in situations where you’ve broken a program into multiple reels, with each reel being a different project. This can be turned on and off via the “Show All Projects” option of the Render Queue Option menu.

Jobs in the Render Queue can be edited (by clicking the pencil button), they can be assigned to remote rendering workstations, and they can be deleted. Jobs that have already been rendered can be kept in the Render Queue and re-rendered at a later time.

The Render Queue displays all jobs

TIP: There is an option to show the Render Settings of each item in the Render Queue, by selecting “Show Job Details” in the Render Queue Option menu. This provides specific details of each job’s dimensions, frame rate, codec etc. This is a great help in managing a complex render queue at a glance.

Drag to Reorder Jobs in the Render Queue

You can manually reorder the Render Queue by dragging a job up and down in the stack. The job numbers will remain in numerical order, but the actual render settings assigned to them will be replaced.

Dragging Job 3 (H.264) in front of Job 2 (ProRes) in the Render Queue
